

THE  
GRYPHON

ATLAS

**First of all,  
thank you for selecting the Gryphon Atlas  
to enhance your listening experience**

The Gryphon Atlas create an evacuation path between the equipment and the outside world, acting as mechanical diodes, conducting energy in one direction and effectively blocking it the other way. Gryphon research has shown that the size, shape and material of spikes can have significant influence on effect. Specifically, brass, steel and other hard materials can actually store some of the energy that they are intended to transfer.

The Gryphon Atlas are made of Polymethylmethacrylate, because the mechanical characteristics of this rigid synthetic make it an ideal bridge for vibration.
